

Stylidium species

PRE-TREATMENT – Smoke pre-treatment has been useful to hasten germination time.

SOWING – Best time for sowing is when temperatures are 15 - 20°C in Autumn through to Winter.

Use a good quality seed raising mix or soil based compost.

Fill pots with media and moisten media before surface sowing seeds, they can be lightly covered with fine grit, compost or washed river sand but only to a depth of the seed.

Best to use capillary irrigation which will not disturb the seeds.

Seeds require light for germination so place in a sunny or well lit area.

Germination can take 7 – 10 weeks to start.

Ensure that the seeds stay moist and don't dry out.
