

Calocedrus species

PRE-TREATMENT – Cold stratification required for 30 – 60 days at 2.5° to 5°C.

SOWING – Use a good quality propagation mix and sow stratified seed in seed trays, best time to sow is early Spring in greenhouse conditions.

Prick seedlings out into individual pots and grow them on in light shade, plant them out in late Spring or early Summer after the danger of frost has passed.

Give some protection from the cold for their first Winter.
