

Ficinia/Isolepsis species

Propagation

PRE-TREATMENT – No pre-treatment is needed for this species.

SOWING – Best propagated in Autumn and Winter.

Use a good quality seed raising mix with added perlite.

Use trays, tubes or individual small pots and fill with seed raising media mix and moisten.

Sprinkle seeds over the top and lightly cover with the media – do not bury seeds too deeply!

Water in gently with a mist spray and place pots in a warm, shaded or part shaded position or even in a greenhouse.

Keep moist and don't allow to dry out.

Seeds should start sprouting in 2 - 4 weeks.

Plant out in the garden when a good root system is established.
