

Kniphofia species

PRE-TREATMENT – No pre-treatment is required for this species.

SOWING – Best time for sowing is 6 weeks before the last frosts in Spring when temperatures are 21 - 24°C.

Use a good quality porous seed raising mix.

Fill pots with media and moisten media before surface sowing seeds.

Surface sow seeds or mix seeds with washed river sand and sprinkle on top of the media.

Mist water to avoid seed disturbance.

Seeds should start sprouting from 21 – 30 days.

Ensure that the seeds stay moist and don't dry out.
