

Zephyranthes species

PRE-TREATMENT – No pre-treatment is required for this species.

SOWING – Use a good quality seed raising media and pot into seed trays or in individual pots.

Fill pots with media and moisten media before surface sowing seeds, cover with washed river sand mixed with the propagation media. Press gently and water with a fine mist spray, be careful to not dislodge seeds.

Place in bright indirect light but not in full sun.

Cover with plastic to increase humidity or place into a greenhouse.

Seeds should start sprouting from 2 – 4 weeks.

Best to use capillary irrigation to not disturb seeds.

Ensure that the seeds stay moist and don't dry out.
